Coded Slotted ALOHA (CSA) – Uncoordinated Multiple Access Scheme

- Frame-synchronous CSA (FS-CSA):
 - Asymptotic analysis using density evolution (DE) [[Liva 2011](#)]
 - Finite-length analysis of the error floor (EF) and all-to-all broadcast [[Ivanov et al. 2016](#)]
- Frame-asynchronous CSA (FA-CSA)
 - Simulation of throughput and delay [[Meloni et al. 2012](#)]
 - Asymptotic analysis using (approximate) DE [[Sandgren et al. 2016](#)]
 - Finite-length analysis of the EF and delay [[Sandgren et al. 2016](#)]

Outcome: FA-CSA vs. FS-CSA

- **Better** performance in the **waterfall and error floor region**
- **Better delay**

System Model

- Time is divided into **slots** and users are **slot-synchronous**.
- Users join the system according to a **Poisson random process** with mean g

$$\Pr(k \text{ users joining}) = \frac{e^{-g} g^k}{k!}$$

- Each user selects a **repetition factor** l according to the degree distribution

$$\Lambda(x) = \sum_l \Lambda_l x^l.$$

- Each user picks l out of n slots (**local frame**) to transmit in.

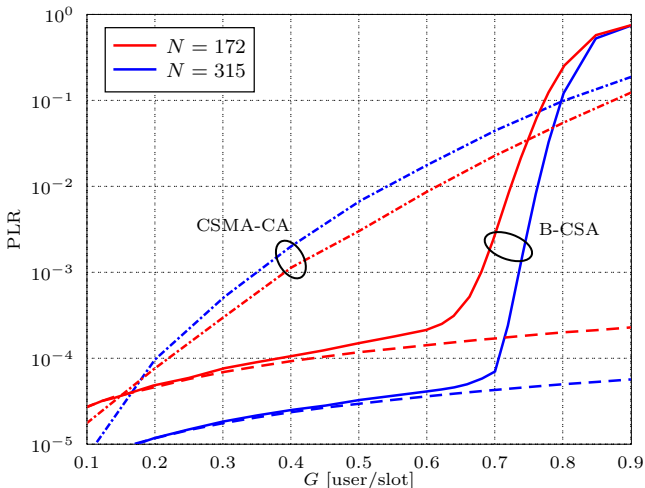

Two main performance metrics

- **Packet loss rate** (PLR).
- **Delay**: number of slots between a user joining the system and its packet being decoded.

WWVC 2014 – CSMA vs. Broadcast-CSA (B-CSA)

Example: $\Lambda(x) = 0.86x^3 + 0.14x^8$

- B-CSA has much **better PLR** than CSMA used in 802.11p.

Encoding – FS-CSA vs. FA-CSA

- $\Lambda(x) = 0.6x^2 + 0.4x^3$, $n = 6$, $g = 0.5$.

- Local frames
 - Degree 2 users
 - Degree 3 users

FA-CSA

of active users :

1 1 2 3 3 3 3 2 2 4 4 3 3 4 3 2

Decoding

- A **common** receiver.
- Packet in slots **without collision** can be reliably decoded.
- Iterative decoding using **successive interference cancelation**.
- The replicas of a received packet can be **perfectly removed** from the signal.

Decoding – FS-CSA vs. FA-CSA

- $\Lambda(x) = 0.6x^2 + 0.4x^3$, $n = 6$, $g = 0.5$.

FS-CSA

FA-CSA

Belief Propagation Thresholds

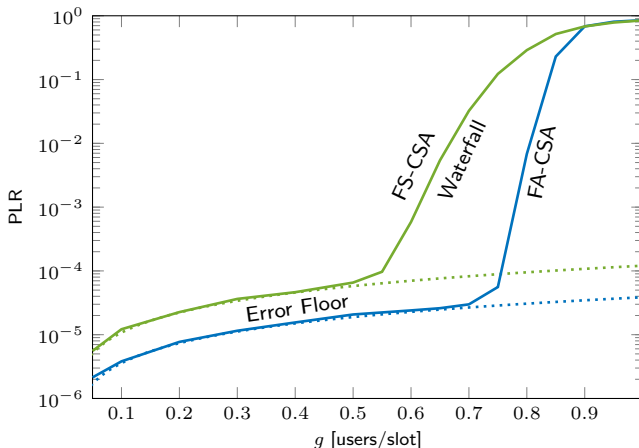

- Number of slots per frame: $n \rightarrow \infty$

Error Floor

Example: $\Lambda(x) = 0.86x^3 + 0.14x^8$ and $n = 200$

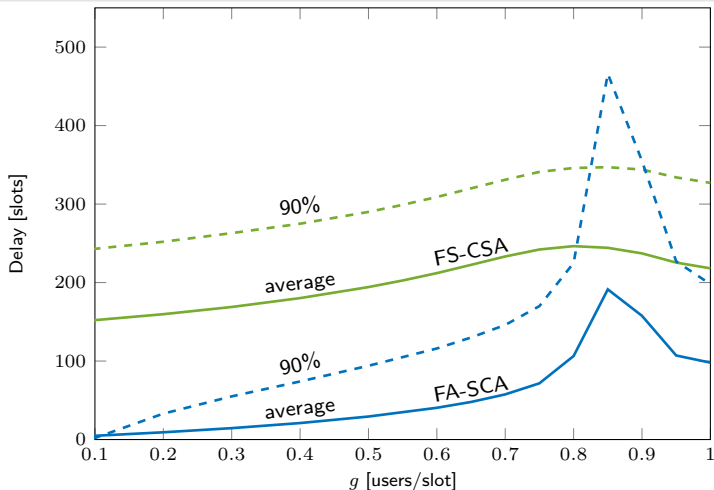

- **Accurate approximation** of the error floor (due to stopping sets).
- FA-CSA achieves **better performance in the WF and EF** than FS-CSA.

Delay Performance

Example: $\Lambda(x) = 0.86x^3 + 0.14x^8$ and $n = 200$

- FA-CSA yields **better delay** than FS-CSA.

Conclusions CSA

Take-Home Messages

- For finite-frame length, FA-CSA outperforms FS-CSA in the waterfall region, error floor region, and delay.
- FA-CSA outperforms FS-CSA in the waterfall and error floor regions also with a maximum delay constraint.
- B-CSA has much better PLR than CSMA used in 802.11p.
