

How-To configure the network

1. Make sure that the network device in the VMWare top bar is set to mode "Bridged". This configuration requires that you take care of the IP-allocation yourself (as we just did) but on the other hand the system will be visible from the outside (physical world).

2. Right-click on the icon with the two screens in the top menu bar.
3. Select "Edit connections".
4. Click on "eth1" and then "Edit". We will now edit the configuration of the wired network interface of the virtual computer.
5. Make the following configurations:
 - a. Select method: manual
 - b. IP Address: 192.168.203.XX
The number XX is found on the right sticker.
 - c. Subnet mask: 255.255.255.128
 - d. Gateway: 192.168.203.1
 - e. DNS: 194.47.0.30
 - f. Click "Ok".
6. Test ping google.com
