Module 1: New Requirements

Intelligent Information Network (IIN)

- Intelligence across multiple products and infrastructure layers
- Active participation of the network in the delivery of services and applications

Three phases in building IIN

- Integrated transport
- Integrated services
- Integrated applications

Service-Oriented Network Architecture (SONA)

Cisco.com

3

Network Models

Cisco.com

- **Campus architecture**
- **Data center architecture**
- **Branch architecture**
- **Teleworker architecture**
- **WAN architecture**

© 2003, Cisco Systems, Inc. All rights reserved.

4

Nonhierarchical Network Devices

Cisco.com

- Large collision domain
- Large broadcast domain
- High latency
- Difficult to troubleshoot

© 2003, Cisco Systems, Inc. All rights reserved.

5

Traffic that can affect network performance:

Cisco.com

Broadcast - traffic that polls the network about component status or availability and advertises network component status or availability

Multicast - traffic that is propagated to a specific group of users

© 2003, Cisco Systems, Inc. All rights reserved.

6

Layer 2 Switching

Cisco.com

- Hardware-based bridging
- Wire-speed performance
- Collision domain per port
- Traffic containment based on MAC address

Issues

- No traffic between VLANs
- Unbounded broadcast domain
- Servers not centrally located

7

Layer 3 Routing

Cisco.com

- Single broadcast domain per interface
- ACLs can be applied between segments

Issues

- High per-port cost
- Layer 3 processing required
- High latency over Layer 2 switching

© 2003, Cisco Systems, Inc. All rights reserved.

8

Multilayer Switching

Cisco.com

- Combined functionality

Layer 2 switching

Layer 3 switching

Layer 4 switching

- Low latency

- High-speed scalability

© 2003, Cisco Systems, Inc. All rights reserved.

9

Issues with Multilayer Switches in a Nonhierarchical Network

Cisco.com

- Single point of failure for Layers 2 and Layers 3

- Underutilization of hardware

- Spanning tree complexity

- Servers not centrally located

© 2003, Cisco Systems, Inc. All rights reserved.

10

Enterprise Composite Model Functional Areas

13

Module 2: Defining VLANs

Cisco.com

Issues in a Poorly Designed Network

FIGURE 1

Issues in a Poorly Designed Network

- Unbounded failure domains
- Large broadcast domains
- Large amount of unknown MAC unicast traffic
- Unbounded multicast traffic
- Management and support challenges
- Possible security vulnerabilities

15

What Is an End-to-End VLAN?

FIGURE

1

- Users are grouped into VLANs independent of physical location.
- If users are moved within the campus, their VLAN membership remains the same.

16

Defining VLANs Local VLAN

Cisco.com

- **Local VLANs should be created with physical boundaries in mind, rather than job functions of the users on the end devices.**
- **Traffic from a local VLAN is routed to reach destinations on other networks.**
- **A single VLAN does not extend beyond the Building Distribution submodule.**
- **VLANs on a given access switch should not be advertised to all other switches in the network.**

© 2003, Cisco Systems, Inc. All rights reserved.

17

Mapping VLANs in a Hierarchical Network

Cisco.com

- **Examine the subnetting scheme that has been applied to the network and associate a VLAN to each subnet.**
- **Configure routing between VLANs at the distribution layer using multilayer switches.**
- **Make end-user VLANs and subnets local to a specific switch block.**
- **Ideally, limit a VLAN to one access switch or switch stack. However, it may be necessary to extend a VLAN across multiple access switches within a switch block to support a capability such as wireless mobility.**

19

How to Implement a VLAN

FIGURES

1

2

3

4

5

6

7

- Create or configure a VLAN.
- Verify VLAN configuration.
- Associate switch ports with the VLAN.
- Verify switch port configuration.
- Test VLAN connectivity.
- Implement VLAN and switch security.

21

Defining VLANs

Trunk Links

Cisco.com

- Two switches
- A switch and a router
- A Switch and a trunk capable NIC in a node such as a server

© 2003, Cisco Systems, Inc. All rights reserved.

22

ISL

Trunking with ISL

FIGURES

1

2

- Is a Cisco proprietary protocol
- Supports PVST
- Uses an encapsulation process
- Does not modify the original frame

All contents copyright © 2008 Cisco Systems, Inc. All rights reserved.

23

802.1Q Trunking

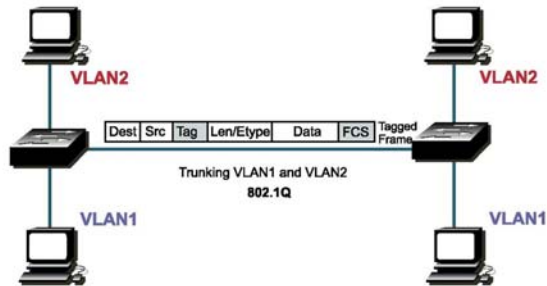

Cisco.com

Trunking with 802.1Q

FIGURES

1

2

- An IEEE standard
- Adds a 4-byte tag to the original frame
- Additional tag includes a priority field
- Does not tag frames that belong to the native VLAN
- Supports Cisco IP Telephony

All contents copyright © 2008 Cisco Systems, Inc. All rights reserved.

25

Defining VLANs VLAN Trunking Protocol

Cisco.com

- VTP maintains VLAN configuration consistency across the entire network.
- VTP is a messaging protocol that uses Layer 2 trunk frames to manage the addition, deletion, and renaming of VLANs on a network-wide basis.
- Further, VTP allows you to make centralized changes that are communicated to all other switches in the network.

© 2003, Cisco Systems, Inc. All rights reserved.

26

The VTP Protocol

FIGURE

1

- Advertises VLAN configuration information
- Maintains VLAN configuration consistency throughout a common administrative domain
- Sends advertisements on trunk ports only

All contents copyright © 2006 Cisco Systems, Inc. All rights reserved.

© 2003, Cisco Systems, Inc. All rights reserved.

27

VTP Modes

VTP Modes

FIGURES

1

2

Server (default mode)

- Creates, modifies, and deletes VLANs
- Sends and forwards advertisements
- Synchronizes VLAN configurations
- Saves configuration in NVRAM

Client

- Cannot create, change, or delete VLANs
- Forwards advertisements
- Synchronizes VLAN configurations
- Does not save in NVRAM

Transparent

- Creates, modifies, and deletes local VLANs
- Forwards advertisements
- Does not synchronize VLAN configurations
- Saves configuration in NVRAM

All contents copyright © 2006 Cisco Systems, Inc. All rights reserved.

28

VTP pruning

Cisco.com

VTP Pruning

FIGURE

1

- Uses bandwidth more efficiently by reducing unnecessary flooded traffic
- Example: Station A sends broadcast; broadcast flooded only toward any switch with ports assigned to the red VLAN

All contents copyright © 2006 Cisco Systems, Inc. All rights reserved.

© 2003, Cisco Systems, Inc. All rights reserved.

29

Implementing VTP in the Enterprise Composite Network Model

FIGURE

1

Implementing VTP

- Plan VTP domain boundaries
- Have only one or two VTP servers
- Configure a VTP password
- Manually configure the VTP domain name on all devices.
- When setting up a new domain
 - Configure VTP client switches first so that they participate passively
- When cleaning up an existing VTP domain
 - Configure passwords on servers first because clients may need to maintain current VLAN information until the server is verified as complete
